

# Pine Jog Elementary, Square of Life, Final Report, 5-20-14

## Science/STEM Lab (Moreno)

Our class collected data in six teams and combined our findings to make a class data report. We compared the class data we collected in West Palm Beach to Ginny's Child Garden in Reno Nevada.

We found ants, dirt, sand, small rocks and a couple of unexpected things. One team found a piece of broken glass when they dug under the soil. Another team found a fossil clam shell when they were digging.

Ginny's Child Garden found a beetle, a big rock, and mud which we did not observe in our squares of life. Both groups of our scientific researchers observed flying bugs, grass, trees, and weeds.

At Pine Jog, we made our observations in our Bamboo Walk/Zen Garden. The grass we observed is our bamboo because the bamboo plant is a grass!

We compared biotic and abiotic organisms in both school sites. We both observed more biotic (living) organisms than abiotic (non-living) things.
